

In our continued effort to make underwater equipment safer and more reliable, NTD offshore is happy to announce the launch of our new line of underwater connectors.

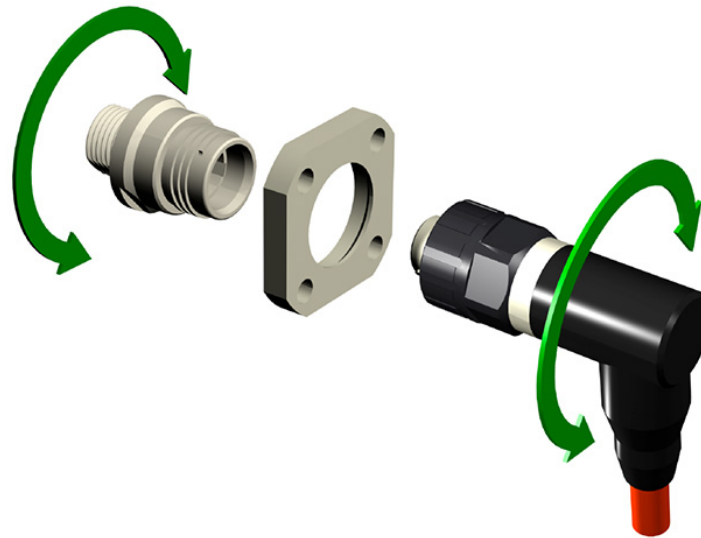

Although the quality of connectors and cables have improved steadily over the years, they continue to be a source of unreliability for underwater systems. In order to address issues with connector reliability, NTD Offshore, in conjunction with a major connector manufacturer, has developed a series of unique and patented underwater connectors.

The line of connectors greatly improves the stability, usability and safety while also lessening the amount the weak points usually found on underwater connectors.
